1.0 Introduction

In the past few years, privacy and security-related issues have risen sharply in importance for the public and private sectors alike. The proliferation of information technologies, which have permanently altered the way in which information is gathered, used and stored, has brought these issues to the forefront of policy-making. In part, this reflects Canadians' rising concerns in this area. Indeed, concerns over the privacy and security of information are particularly acute when it comes to technology usage in the health-care sector. That said, Canadians also recognize that access to personal health information is an integral part of a quality health care system.

As of January 2004, the Personal Information Protection and Electronic Documents Act (PIPEDA) became applicable to the health sector, including entities such as private pharmacies, laboratories and health care providers in private practice, unless a province has enacted substantially similar legislation. The privacy and confidentiality legislative regimes for the collection, use and disclosure of health information in place in Canada recognizes the central importance of achieving the appropriate balance between the protection of privacy of the individual and the confidentiality of their information while enabling access to information to provide patient care and to manage the health system.

Canadians' attitudes and expectations regarding the protection of their privacy and the confidentiality of their health information are changing in response to increased knowledge of the health system's use of personal health information and increased information technology initiatives. Federal, Provincial and Territorial governments are currently working on the Health Information Privacy and Confidentiality Framework to address Canadians' privacy and confidentiality expectations in relation to their health information. The Framework provides a harmonized set of principles and rules for the collection, use, disclosure and protection of personal health information of Canadians, and will usher in a new era of privacy protection in the health care arena.

It was against this backdrop that EKOS Research was commissioned to undertake the current research project in order to inform and support the Federal, Provincial and Territorial decision-making process on the Personal Health Information Privacy and Confidentiality Framework.

2.0 Methodology

This report provides results for the survey on the Pan-Canadian Health Information Privacy and Confidentiality Framework.

- The results are based on telephone surveys with 2,500 Canadians, 16 years of age and over.
- Interviews were conducted between August 23rd and September 14th, 2004.
- The survey was an average of 21.5 minutes in length.
- A stratified random sample of Canadians was used in order to ensure a certain sub-sample in each province/territory. All the data were then statistically weighted back to ensure the sample's regional, gender and age composition reflects that of the actual population of Canada according to Census data.
- With a sample size of 2,500, the results from this survey may be considered statistically accurate to within +/- 2.0 percentage points, 19 times out of 20.
- The margin of error increases when the results are sub-divided (i.e., error margins for sub-groups such as regions).
- The sample sizes broken down by region as well as the margins of error for the individual regions are summarized in Table 1.

Table 1 – Distribution of Telephone Sample

Distribution	Territ- ories	BC	Alberta	Prairies	Ontario	Quebec	Atlantic Canada	Total
Sample Size	50	348	300	299	650	502	351	2500
% of sample	0.4	13.3	9.6	6.9	37.8	24.0	7.9	100.0
Margin of error (%)	14.0	5.3	5.7	5.7	3.8	4.4	5.2	2.0

The questionnaire was designed in close consultation with the client. It examines a number of issues relating to different aspects of the proposed Framework. It also establishes important benchmarks from which to gauge any changes in attitudes as the debate around the privacy and confidentiality of personal health information unfolds. In addition, several other basic indicators were incorporated in order to gauge the impact of interaction with the health care system on respondents' attitudes (see Appendix A).

In order to gauge the flow and clarity of the of the survey instrument, the questionnaire was pretested over the telephone in English with 25 cases on August 23rd, 2004. Following the pretest, a few minor revisions were made to clarify certain questions and to adjust the focus of others before the final English survey was fielded on August 24th, 2004. An identical version of the French version of the questionnaire was pretested with 22 cases on August 27th, 2004. No changes were required to the French questionnaire and the final version was fielded August 28th, 2004. The final English and French versions of this survey are provided in Appendix B.

Several different approaches were taken in designing the survey to make it as efficient as possible:

- In order to minimize any order bias, questions in a specific battery were randomized. For example, the order in which the questions in the agree-disagree battery were posed was randomized such that respondents did not get the same questions in the same order.
- Split samples, in which only half of respondents are asked a certain question, were also employed to minimize response burden on respondents and keep the survey to a manageable length.
- Certain attitudinal and behavioural questions were also asked with the express purpose of cross tabulating them with other indicators in the survey. This was done to explore whether or not there are any differences in attitudes, for example, between respondents who had visited a hospital recently and those who had not.

Throughout the report, quotes are used to exemplify some of the more common attitudes expressed by Canadians. These verbatim statements are drawn from the two open-ended questions respondents were asked during the survey. The quotes however, are scattered throughout the report as they speak to a number of different aspects of the proposed Framework.

3.0 Key Highlights

Overall

The current public environment reveals **broad confidence** in the proposed health privacy and confidentiality framework. This confidence coexists with considerable concern about potential abuses of personal health information.

While Canadians express broad comfort on several fronts, it is equally clear that this balance of confidence and concern is not rooted in significant reflection, knowledge or personal experience.

- It is therefore important to recognize that these **favourable results could change either** positively or negatively as the public debate unfolds.
- The currently favourable lean to the framework appears to be quite decisive and strengthened as respondents reflected throughout the survey (e.g., perceptions regarding the safety and security of health information rose 10 percentage points from the beginning to the end of the survey).

It is also important to recognize the primacy of public and individual health over privacy concerns in this debate.

- Quite bluntly, while the public is concerned about privacy issues, other concerns such as the quality and efficiency of the health care system eclipse privacy concerns.
- This current lean probably reflects a broader diminution of concerns with the human rights/civil liberties side of the debate in the post-9/11 world.

There are three key forces underlying current support:

1. relatively scant experience of privacy, confidentiality and security-related problems;
2. comfort that there are rules/guidelines in place and that someone is minding the store; and
3. rock solid trust in health professionals, particularly doctors.

There is a small, but significant minority group that is opposed to some of the key issues regarding consent (about one in five). Opponents are likely to be more engaged and active in the debate than supporters.

- Concerns that exist centre on the perceived ease of unauthorized access; however, this is not seen as a looming threat.
- In contrast, comfort reflects high trust levels, the absence of negative experiences and a general belief that health information is safe.

While virtually all frontline health care service providers score exceptionally well, there still exists a clear hierarchy in terms of trust levels, especially when it comes to keeping health information safe and secure.

- Canadians possess extremely high levels of trust in their family doctors, but there is a notable drop for other direct health care providers (e.g., pharmacists, nurses), although the scores are still high.
- Other players (e.g., government health departments, medical researchers, insurance companies) score lower.
- There is also relatively high confidence that only authorized users have access to health information and that the systems used to store information are secure.

Proposed measures have a positive impact on Canadians' confidence in the safety and security of health information, although there is still a hierarchy of preference.

- Rules and sanctions for health care professionals are important, as is opportunity for access to the individual's own information.

Canadians are very **comfortable with the concept of knowledgeable implied consent** for use and disclosure of information as it relates to health care professionals.

- Underpinning this comfort is the link to better care as well as confidence in the system and with health service providers.
- Selective disclosure and ability to withhold certain information within the knowledgeable implied consent model increases comfort.

Comfort with other areas of the framework ranges from clearly supportive to clearly opposed.

- There is support for usages related to public health needs, to prevent fraud, and, to a lesser extent, medical research. Also, strong support for broader police powers.
- There is strong opposition to usages related to fundraising and religious/spiritual counseling.

Brochures/pamphlets/notices are seen as an acceptable way of informing Canadians about the collection, use and disclosure practices with the health system, but they are practically invisible to large numbers of the public.

- There are modest marks on effectiveness (particularly tepid amongst those unaware), but little concern/opposition to their use.

4.0 Faits saillants

Aperçu général

L'opinion publique courante révèle une **confiance étendue** dans le cadre de travail proposé en matière de protection du dossier de santé personnel. Cette confiance s'accompagne de beaucoup d'inquiétude quant à l'utilisation abusive dont ces renseignements personnels pourraient faire l'objet.

Bien que les Canadiens et les Canadiennes se sentent rassurés sur plusieurs aspects, il est évident que cet équilibre entre confiance et méfiance ne repose pas sur énormément de réflexion, de connaissances ou d'expériences personnelles.

- Il importe par conséquent de reconnaître que **ces résultats favorables pourraient changer** de façon positive aussi bien que négative à mesure que le débat public prendra de l'ampleur.
- Pour l'instant, le penchant favorable à l'égard du cadre de travail semble être décisif et se renforcer si l'on en juge par les réponses obtenues au fil du sondage (p. ex., l'impression de sécurité touchant les renseignements personnels sur la santé a gagné 10 points de pourcentage entre le début et la fin du sondage).

Il importe également de reconnaître que dans ce débat, la santé publique et individuelle prime sur les préoccupations touchant la protection des renseignements personnels.

- À vrai dire, si le public s'inquiète de la protection des renseignements personnels, ses préoccupations concernant la qualité et l'efficacité du système de soins de santé prennent le dessus.
- Le penchant actuel reflète probablement une baisse de préoccupation générale relativement aux droits de la personne et aux libertés civiles dans la foulée des événements du 11 septembre.

Trois grands facteurs peuvent expliquer la faveur actuelle :

4. une expérience relativement rare de problèmes reliés aux questions de protection des renseignements personnels, de confidentialité et de sécurité;
5. la conviction qu'il existe des règles et des lignes de conduite et que quelqu'un veille au grain;
6. une confiance inébranlable dans les professionnels de la santé, en particulier dans les médecins.

Un groupe minoritaire, petit (environ un sur cinq) mais significatif, s'oppose à certains des principaux enjeux en matière de consentement. Il faut s'attendre à ce que les opposants interviennent davantage dans le débat que les partisans, et soient plus militants.

- Les préoccupations qui existent portent sur la facilité apparente d'un accès non autorisé; toutefois, cette menace n'est pas jugée imminente.
- À l'opposé, le sentiment de sécurité reflète des niveaux de confiance élevés, l'absence de mauvaises expériences et la conviction générale que les renseignements de santé sont protégés.

Bien que presque tous les fournisseurs de soins de santé de première ligne soient particulièrement bien cotés, il se dégage néanmoins une nette hiérarchie dans les niveaux de confiance, surtout lorsqu'il s'agit de protéger les renseignements sur la santé.

- Les Canadiens et les Canadiennes possèdent un niveau de confiance extrêmement élevé dans leur médecin de famille, mais ce niveau baisse de façon sensible en ce qui concerne les autres intervenants de première ligne (p. ex., pharmaciens, infirmières), lesquels obtiennent toutefois de bonnes notes.
- Les autres intervenants (ministères de la Santé, chercheurs médicaux, compagnies d'assurance) sont moins bien évalués.
- Il règne une assez grande confiance aussi dans l'idée que seuls les utilisateurs autorisés ont accès aux renseignements de santé et que les systèmes servant à entreposer cette information sont sécuritaires.

Les mesures proposées ont un effet positif sur la confiance que les citoyens ont dans la sûreté et la sécurité des renseignements personnels sur la santé, bien qu'il y ait une hiérarchie dans les préférences.

- Les règles et sanctions à l'égard des professionnels de la santé sont jugées importantes, tout comme la possibilité pour chacun d'accéder à son propre dossier de santé.

Les Canadiens et les Canadiennes sont très **à l'aise avec le concept de consentement tacite éclairé** pour l'utilisation et la divulgation des renseignements de la part des professionnels de la santé.

- Cette acceptation est liée à l'espérance de meilleurs soins et à la confiance dans le système et les fournisseurs de soins de santé.
- La divulgation sélective et la possibilité de retenir certains renseignements, prévues dans le modèle de consentement tacite éclairé, renforcent encore cette acceptation.

D'autres aspects du cadre de travail suscitent diverses réactions allant d'un net soutien à une vive opposition.

- On appuie l'utilisation des renseignements aux fins de la santé publique, pour prévenir la fraude et, dans une moindre mesure, pour la recherche médicale. L'élargissement des pouvoirs policiers reçoit aussi un ferme appui.
- L'utilisation des renseignements en vue d'une levée de fonds et dans le cadre du counselling religieux ou spirituel soulève une forte opposition.

Les brochures, dépliants et avis sont perçus comme des moyens acceptables d'informer les Canadiens et les Canadiennes sur les méthodes employées par le système de santé pour la cueillette, l'utilisation et la divulgation de renseignements, mais ils demeurent invisibles pour de vastes pans de la population.

- Ils ne sont pas jugés d'une très grande efficacité (en particulier par ceux et celles qui ne les connaissent pas), mais leur utilisation suscite peu d'inquiétude ou d'opposition.

5.0 Canadians' Broad Perceptions of Personal Health Information

"I believe that doctors need to have your medical history to provide better care."

Use of health information by health care professionals

Q: Please rate the degree to which you agree or disagree with the following statements.

Base: All Canadians; Aug./Sept. 04, n=2500

"[Doctors] have to have all the information to make a diagnosis."

Striking a balance: privacy vs. access to health information

Q: The health care system recognizes the need to find a balance between protecting an individual's privacy and ensuring that the health system has access to the health information needed to provide Canadians with access to care and treatment. Thinking about this balance, which of the following is the MOST important consideration for you personally?

Base: All Canadians; Aug./Sept. 04, n=2500

"The more information provided about you, the better chance of care."

General Attitudes

Canadians express a high degree of comfort with the use of health information by health care professionals.

There is a shared understanding among the general public that access to personal health information by health care professionals is integral to the provision of quality health care in this country. Indeed, more than eight in ten (84%) agree that timely and easy access to patient information is necessary in order for physicians and other health service providers to give high quality care to Canadians.

A similar proportion (81%) of the public also sees the merit in health care professionals having access to their personal health information if it would benefit them personally (e.g., if it would result in better treatment for them).

- Across the country, support for health care professionals having access to health information is highest in Ontario and British Columbia (84% each) and lowest in Quebec (73%).

It is important to recognize that, in the context of this debate, concerns about public and individual health eclipse all other considerations, including privacy. Indeed, when asked to contemplate the balance between protecting an individual's privacy and ensuring that the health care system has access to information needed to provide quality care, Canadians rank quality ahead of privacy nearly eight times out of ten.

Overall, a majority of the public (56%) believes that the effectiveness/quality of care for all Canadians is the most important consideration to them personally, while an additional one in five (20%) considers the effectiveness/quality of care personally received to be the top priority. Only about one in ten (13%) consider the costs/efficiency of the health care system the number one concern. The need to safeguard the confidentiality of personal health information ranks the lowest, with fewer than one in ten (nine percent) citing it as the most important consideration.

- Concern with quality of health care for all Canadians decreases consistently and significantly with age (63% of those under 25 years of age list this as the number one priority compared to 45% of those over 65 years of age).

**"They should ask for some
sort of picture
identification to
prove who you are
before handing
out your
information."**

Perceived confidentiality of health information

Q: Please rate the degree to which you agree or disagree with the following statements.

Health care professionals and those providing health-related services should be the only ones who ask to see your provincial health care card.

I have a good idea of who to turn to if I ever experience an invasion of my privacy with respect to my health information.

I feel I have less personal privacy with respect to my health information than I did five years ago.

0 25 50 75 100
 ■ DK/NR ■ Disagree (1-3) ■ Neither (4) ■ Agree (5-7)

Base: All Canadians; Aug./Sept. 04, n=2500

**"These days,
information
seems easier
to access;
health information
is not exempt of
that."**

**"From personal experience, it's too easy to receive information
about others. When you ask for [information] sometimes there is confusion over
same names. Also, you can see other's files accidentally."**

Perceptions of Privacy

In terms of the privacy of their health information, Canadians have mixed views.

While quality health care is undeniably Canadians' primary objective, the public also express genuine concern regarding the privacy of health information. For example, more than eight in ten (84%) agree that health care professionals and those providing health-related services should be the only ones with access to personal health information (e.g., health information that is available through provincial health cards).

Despite having concerns about access to their personal health information, Canadians are divided as to whether or not they feel the privacy of this information has decreased over the past five years (35% agree and 36% disagree). Overall, one in four (25%) say they are unsure whether or not their privacy has been affected.

- Perceptions regarding the loss of privacy increase substantially with age (27% of youth say they have less personal privacy compared to 45% of seniors).
- Income and education have the reverse effect, with those of higher socioeconomic status far less concerned than those with a lower socioeconomic status.

Given these concerns, it is somewhat surprising that nearly one-half of Canadians (47%) say they are unaware of whom they should contact if they experience an invasion of their privacy with respect to their personal health information. That said, there is still a sizable portion of the population (38%) who do say they know who to turn to if something like this were to occur.

- Across Canada, residents of Quebec and the Atlantic region are the most likely to report knowing where to seek help in case of an invasion of their privacy (47 and 48%, respectively, compared to 38% nationally).
- Interestingly, those who are most likely to report having less personal privacy than they did five years ago (e.g., seniors, low socioeconomic status), are all more likely to say that they know where to go if their privacy is invaded.

**"I know my doctor
well."**

Trust in health care professionals

**"Doctors have good
intentions"**

Q: How much trust do you have in the following groups to keep your health information safe and secure?

**"I have
extreme
trust in my
family
doctor."**

**"I trust my
physician."**

Q: Using the same scale, how much trust do you have in ... to keep Canadians' health information safe and secure?

**"I have been going to
my doctor for years
and I trust her
implicitly."**

**"I think the big
drug
companies
are using
somebody's
data."**

Base: All Canadians; Aug./Sept. 04, n=2500, * half sample, **1/3 sample

"Doctors are professionals – I've never had any bad experiences."

Trust levels

There is a notable hierarchy in terms of trust levels relating to keeping health information safe and secure.

When it comes to the safety and security of their health information, Canadians express extremely high levels of trust levels in most frontline health care professionals.

Predictably, doctors are the most trusted, with one in two (52%) giving them the highest trust scores (a 7 on a 7-point scale). Pharmacists (28%), nurses (26%), and administrators in the family doctor's office (26%) also receive high marks, with more than one in four saying they have "a great deal of trust" in them. Interestingly, health care providers in hospitals (18%) are accorded lower levels of trust, but are still trusted. For all of these professionals, another 30 to 40 percent assign high trust (a score of 5 or 6 on the same scale), while less than one in ten assigns low trust.

While virtually all frontline providers score well, the public is less trusting of those not involved in providing direct care. For example, only about one in ten give those working for Government health departments (11%) and insurance companies (nine percent) the highest trust rating.

- Across the country, those living in the Atlantic region are more likely than those living elsewhere to place the highest level of trust in all health care professionals.
- Those with a high school education or less are far more trusting of all health care professionals than those with greater levels of educational training.
- With the exception of government health departments, seniors place more trust in health officials to keep their information safe than any other age group.
- On average, women tend to accord higher trust to frontline health care professionals.

For the most part, health researchers are also seen as largely trustworthy, although they are only slightly more trusted to keep health information safe and secure than insurance companies or government health departments. In terms of the different types of researchers, those working for the private sector are regarded as slightly less trustworthy (10% give them the highest trust score) than those working in a government or university setting (12% give them the highest score).

6.0 Perceived Safety and Security of Personal Health Information

"I have worked in a hospital and the information is very safe and secure."

Perceived safety and security of health information

Q: In your opinion, how safe and secure is the health information which exists about you?

"People are able to hack in the computer and access anything."

"There is no reason for my information not to be safe and secure."

Q: Why do you say that?*

	Perceived Safety and Security of Health Information						
	1 Not at all safe and secure	2	3	4 Moderately safe and secure	5	6	7 Extremely safe and secure
Anybody can access information	40	39	32	16	13	2	1
Storing on computers is not safe (e.g., hackers)	24	31	27	20	11	3	1
Don't know who has access	16	17	14	14	12	2	0
Only health care providers should be able to access	10	10	12	7	6	1	1
Government can find out anything it wants	4	10	10	2	2	1	0
Knowledge of negative incident	14	11	5	3	2	1	0
Storing on computers is safe (e.g., passwords, security measures)	3	3	4	3	6	7	8
No negative experiences	5	2	2	8	14	26	25
Regulations and procedures in place to ensure safety	2	2	2	4	10	18	12
Health care information hard to access	1	2	1	3	4	6	3
Trust health care providers	0	0	1	6	11	26	30
Believe personal information is safe	0	0	1	7	12	20	23
Other	4	2	2	3	2	1	3
DK/NR	2	2	7	18	12	4	8

*Asked after first appearance of question on safety and security of health information

Base: All Canadians; Aug./Sept. 04, overall n=2500

"Because of computers, people can access any information about you."

"I trust my own doctor. They keep that information amongst themselves. I assume that they're doing their best."

"I never really thought of that before. I always assumed it was safe."

Broad Perceptions

Canadians are definitively positive in their broad perceptions of the safety and security of health information.

When asked at the start of the survey, a plurality (42%) of Canadians reports that their health information is "safe" (5 to 7 on a 7-point scale). Another 37 percent say that the information is "moderately safe" and only 16 percent worry that the information is "not very safe" (1 to 3 on a 7-point scale).

In order to determine whether or not the survey was having an impact on respondents' attitudes, the same question regarding the perceived safety and security of health information was asked again at the end of the questionnaire. Upon repeated measure of this question, it was found that there was an improvement in perceptions, with a majority (56%) now saying that their health information is "safe", suggesting that Canadians attitudes in this area are largely undeveloped and malleable following a debate of the issues. It should be noted, however, that there is a small proportion of the population (approximately 10%) who are decidedly opposed and whose perceptions do not improve following a discussion of the issues.

- Those who are not very confident that access to their health information is restricted to health care professionals are considerably more likely to say that this information is not very safe (50% compared to five percent who are confident that access is restricted).

The fear of information being accessed by an unknown source (e.g., a hacker) is the most commonly cited reason for why health information is not regarded as safe (accounting for about three-quarters of the reasons provided). The idea that government can find out anything it wants and knowledge of a negative incident are some of the other main reasons mentioned.

For those less concerned about the safety and security of their health information, a genuine trust in health service providers seems to dominate their thinking on the issue. Likewise, a lack of negative experiences and the general belief that health information is safe also pervades.

"Printed information is not safe. Anyone can access. If it was in a computer system, it would require a password and that is more safe."

Confidence that access to health information is restricted

Q: How confident are you that only authorized individuals are able to access the health information that exists about you?

"Everything is in the computer and computers aren't that safe."

"It is very easy to get information if people know the computer system."

Q: How confident are you that the systems and technologies used to store health information are secure?

Base: All Canadians; Aug./Sept. 04, n=2500

"[Doctors] have to know the history of the patient."

"I have never encountered any examples where it wasn't safe and secure. [However], the Internet makes it difficult to be absolutely sure."

Restricted Access to Health Information

Canadians are fairly confident that access to their health information is restricted.

With a majority of Canadians convinced that their health information is, for the most part, safe and secure, it is perhaps not surprising that they also express a great deal of confidence that access to this information is limited. Indeed, nearly half (47%) of the public say that they are confident (5-7 on a 7-point scale) that only authorized individuals have access to their health information, and an additional 30 percent are moderately confident that this is the case.

It is worth noting, however, that there is a sizable proportion of the population (21%) that has little confidence that access to their health information is restricted to authorized individuals only.

- Across the country, those living in Quebec are the most confident that their health information is restricted (54% rate their confidence 5-7 on a 7-point scale).
- Those 45-64 years of age are least confident (40% compared to 63% of youth, 49% of those 25-44 and 47% of seniors).
- Confidence decreases as income and level of educational attainment rise.

A plurality of respondents (43%) are also highly confident (5-7 on a 7-point scale) that the systems used to store their health information are secure and about one in three (28%) are at least moderately confident in these technologies (a 4 on the same scale). However, as was the case with concerns about access, there is a portion of the public (26%) that remains unconvinced that the systems used to store this information are secure.

- Older Canadians, and those with higher socioeconomic status are also less confident in these technologies.

"It's difficult to get inaccurate information changed once it is on a health record."

"You hear in the news about private information [being] made public. Mistakes happen."

Measures to increase confidence

Q: Do the following make you more or less confident that your health information will be safe and secure?

"There is the element of not knowing where your information is, so how can you track it down?"

Base: All Canadians; Aug./Sept. 04, n=2500, half sample

"It depends on what they are using it for. If they are sharing information so they can help, then they can share it. But, if [they are sharing it] for other reasons, I might not feel completely comfortable."

Measures to Increase Confidence

A number of different measures can be taken to increase confidence in the safety and security of health information, although there is still a hierarchy that emerges.

Majorities of Canadians say that the provisions tested in the survey would increase their confidence that their health information is safe and secure. About one in ten (nine to 15%) say that these efforts would actually make them less confident. At the same time, there is also a sizable proportion of the population (ranging from 17 to 25%) who say that these measures would have no impact.

- Knowing that health care providers must adhere to security safeguards to prevent unauthorized access tops the public's list of things that could be done to increase their confidence in the safety and security of their health information (a view held by 72%).
- This is followed closely by knowing that health care providers who do not respect the laws pertaining to the privacy of health information are subject to fines and penalties (71%).
- Being able to access and review their own health information is the next most popular option, and makes 70 percent of Canadians more confident.
- Knowing that they have the right to request corrections to their health information also holds a great deal of appeal, and inspires more confidence in approximately two-thirds of the public (65%).
- Having the right to withhold certain information from health care providers increases confidence in more than one-half of Canadians (59%).
- Although it is seen as the least effective of the measures examined, a majority of Canadians still indicate they would feel more confident knowing that there are independent bodies such as federal and provincial Privacy Commissioners that are responsible for investigating and resolving complaints (58%).

7.0 Consent Relating to the Use and Disclosure of Health Information for Care and Treatment

"The information is important to share in order to have the best treatment possible from other doctors."

"Without at least asking, I do not think it is correct [for information to be shared] – unless there is an emergency."

Comfort with concept of knowledgeable implicit consent

Q: How comfortable are you with your doctor sharing your health information with another health service provider who is providing care and treatment to you without explicitly asking for your permission.

"It depends on where [the information] is going (i.e., to another doctor's office)."

Q: Why do you say that?

	Comfort Sharing Information without Consent						
	1 Uncomfortable	2	3	4 Somewhat comfortable	5	6	7 Comfortable
Would prefer to give consent and know what info. is being shared	62	75	52	29	18	2	2
Health care information is private	18	9	17	3	1	0	0
Depends on type of information	8	9	10	7	4	0	0
Do not trust doctors	5	4	4	2	3	0	0
Trust doctors	3	3	5	14	21	27	32
Depends on quantity of information – only share what is essential	1	3	6	3	2	1	0
Doctors only share relevant information	2	1	5	11	10	8	10
Already must sign a document for information to be shared	2	1	2	1	1	1	0
Sharing info. essential for better health care	2	1	3	29	42	63	63
Regulations control sharing of information	1	1	1	1	3	1	1

"It' saves a lot of time. It's normal for two doctors to share medical information about a patient being treated."

"I think they should ask permission - my physician always asks for my permission."

Base: All Canadians; Aug./Sept. 04, overall n=2500

"[Doctors] wouldn't be sharing the information if it wasn't necessary for my health. They should be able to share the information – especially if it's an emergency."

Different Models for Sharing Information

A majority of Canadians are highly comfortable with the concept of knowledgeable implied consent for use and disclosure of health information for care and treatment.

A large majority of Canadians are, at the very least, somewhat comfortable with their doctor sharing their health information with another health service provider who is treating them without their express consent (81% rate their level of comfort between 4-7 on a 7-point scale).

Again, however, it is important to note that about one in five (20%) express some serious misgivings with this concept (10% say they are extremely uncomfortable and an additional 10% rate their level of comfort as a 2 or 3 on the 7-point scale).

There are some interesting variations in terms of comfort with knowledgeable implied consent:

- Across Canada, those living in Quebec are the least comfortable with this concept (24% rate their level of comfort 1-3 on the 7-point scale).
- Older Canadians are far more comfortable with the implied consent framework. In fact 41 percent of seniors say they are extremely comfortable (a 7 on the 7-point scale) compared to 23 percent of youth.
- Interestingly, those who rate themselves as being in poor health are more inclined than those in better health to be extremely comfortable with their doctor sharing their information without their express consent.

Comfort with the knowledgeable implied consent model appears to be rooted in the belief that sharing information is linked to better health care. Indeed, for those who are comfortable with this concept, most (63%) say it is because they believe that sharing information is essential for receiving the best possible care. A sizable proportion (32%) also says that it is because they trust their doctor and that this trust extends to the belief that doctors share only relevant information.

For those uncomfortable with this concept, most say that it is because they would prefer to give consent (62%) or to know what information is being shared (18%). Some also say that health information is private and that their level of comfort would depend largely on the type of information that is being shared (8%).

"It is part of the doctor's responsibility not to pass it around, unless referring it, or being given permission."

"[My] doctor wouldn't pass along my information unless they have a good reason."

Increasing comfort with information sharing

Q: How comfortable are you with your doctor being able to share your health information with another health service provider who is providing care and treatment to you, but you are able to decide whether or not certain information is passed on?

"I wouldn't mind information going out without my name attached to it..."

Q: What impact does being able to withhold certain information, that is, decide whether certain information about you will be used, have on your level of comfort with your doctor sharing your health information with another doctor?

"If I haven't authorized it, it shouldn't be given out."

Base: All Canadians; Aug./Sept. 04, n=2500

"[Doctors] should get authorization from a patient about how much information they can transfer."

Ways to Increase Comfort

Being able to withhold certain information within the knowledgeable implied consent model increases comfort with this concept.

While a majority of the public is already comfortable with the concept of implied consent, comfort levels rise dramatically when Canadians are given the opportunity to limit the information that is passed on. Indeed, more nine in ten (93%) express some level of comfort when told that they can determine what information is shared. Further, there is almost no opposition to this approach to information sharing (only five percent continue to be uncomfortable).

- While this notion resonates across the country, those living in the British Columbia (45%) and the Atlantic region (51%) are most likely to say they are extremely comfortable (7 on a 7-point scale) with doctors sharing information under these circumstances.

Similarly, two-thirds (63%) of Canadians say that being able to withhold certain information would have a positive impact on their level of comfort and fewer than one in ten (nine percent) say this would negatively impact their comfort level. One in four (25%) are steadfast in their views on information sharing and say that the ability to withhold certain information would not impact their level of comfort.

Use of brochures to inform Canadians

Q: Have you ever read notices, brochures, and pamphlets in your doctor's office that informed you of how your health information is being used?

Q: [Filter: those who **have** read notices, brochures or pamphlets] How effective **are** the notices, brochures, and pamphlets in your doctor's office as a way of informing you about how your health information is used?

Q: [Filter: those who **have not** read notices, brochures or pamphlets] How effective **do you think** notices, brochures, and pamphlets in your doctor's office **would be** as a way of informing you about how your health information is used?

Q: And how comfortable are you with your doctor sharing your health information without your explicit consent in order to provide you with care and treatment given that there are notices, brochures, and pamphlets in your doctor's office that inform you of how the information is used?

Base: All Canadians; Aug./Sept. 04, n=2500

Informing Canadians

Low visibility of brochures/pamphlets/notices, but Canadians lean towards their possible intended usage.

One in five Canadians (20%) say that they have read notices, brochures, or pamphlets in their doctor's offices that informed them of how their health information was being used. Indeed, a majority of the public say they have never read any of these kinds of communications.

- At a national level, Ontarians (24%) are most likely to have read these communications, whereas those living in Quebec (14%) are least likely to be aware.
- Canadians with high socioeconomic status are less aware than those with lower than average socioeconomic status.
- Canadians who rate their health as being "fair" to "poor" (28%) are somewhat more likely than those who consider themselves to be in better health (17% of who rate their health as being "good") to have been exposed to these forms of communications.

Despite low levels of visibility across the country, most Canadians assign modest marks towards the use of notices, brochures and pamphlets as tools for informing the public. In fact, a majority (72%) of those who have not seen these communications think that they would be somewhat effective to extremely effective (5-7 on a 7-point scale). For those who have been exposed to these sorts of notices, a majority rates them positively (59% rate the effectiveness between 5-7 on a 7-point scale and another 25% say they are somewhat effective).

Overall, Canadians show little opposition to the use of these notices, brochures and pamphlets as a way of informing them about how their health information is used. Indeed, more than three in four say that the very existence of these forms of communications makes them more comfortable with the idea of their doctor sharing their health information without their explicit consent (79% rate their comfort between 4-7 on a 7-point scale).

8.0 Consent Relating to Other Uses of Health Information

"I have not had a problem with confidentiality

when it comes to the doctors, but not the receptionist."

"[Information] is seen by other people than the doctors

themselves. There is a high turnover of receptionists."

Comfort with administrative use of health information

Q: I am going to read to you some examples of when information can be used or shared without your consent and I would like you to tell me how comfortable you are with each of the following.

Your health info. being accessed by health service providers and departments to better anticipate and address the health needs of the public, including dealing with things like the spread of diseases such as SARs

Your health info. being monitored by health service providers and departments to prevent fraud against the health care system

Your health info. being accessed by health service providers and departments to improve the management of the health system through better planning, monitoring, and evaluating of how well health care money is being spent

0 25 50 75 100
 ■ DK/NR ■ Not at all comfortable (1) ■ (2-3) ■ Somewhat comfortable (4) ■ (5-6) ■ Extremely comfortable (7)

Base: All Canadians; Aug./Sept. 04, n=2500

"If someone really wanted to go out of their way to get the information, they could just walk in and get it."

"I know for a fact you can have a copy of [an] archived file for your insurance company. Nowadays, [there are] so many frauds going around, anyone can pretend to be a company."

Use in the Administration of the Health Care System

Canadians are largely comfortable with the use of their personal health information in the administration of the health care system.

For the most part, the public is fairly comfortable with the administrative usage of their personal health information without their express consent. For example, more than three-quarters of Canadians (77%) say they are comfortable (5-7 on a 7-point scale) with their health information being accessed by health service providers and departments, if the information will be used to better anticipate and address public health needs such as dealing with the spread of infectious diseases.

A majority of Canadians (75%) are also comfortable with this information being monitored in order to prevent fraud against the health care system. Similarly, approximately seven in ten (72%) say they are comfortable with their information being accessed and monitored in order to improve the management of their health care system (e.g., to monitor how money is spent).

- Older Canadians are less likely to be comfortable with any of the administrative uses of their personal health information than are younger Canadians. For example, 63 percent of those 65 years of age or older say they are comfortable with their health information being used to better manage the health care system compared to 79 percent of youth.
- Not surprisingly, Canadians who are, in general, less comfortable sharing their health information without giving consent are also far more likely to be uncomfortable with the administrative use of this information.
- Similarly, respondents who are concerned about the safety and security of the health information, along with those who are not confident that only authorized users have access to their personal health information, are far less comfortable with the aforementioned uses of this information.

"The framework in which medicine is practiced in North America is defined mainly by the needs of corporate pharmaceutical interests rather than the interests of Canadians..."

Use of health information in research

Q: How comfortable are you with health researchers having access to your health information for research purposes?

Base: All Canadians; Aug./Sept. 04, n=2500

"If [my health information] will be used for a good cause or if it will be used to improve the lives of other patients, I don't mind."

"I have no idea what they would research about. I don't know how far they would go for using us as samples."

"Things that my doctor may discover are important to share if we are talking about health for Canadians."

Use in Research

Many Canadians are comfortable with researchers accessing their health information.

Most Canadians do not seem to have a problem with researchers accessing their health information for research purposes. Indeed, almost seven in ten say they are comfortable with this concept (69% rate their level of comfort between 5-7 on a 7-point scale, and another 19% say they are at least somewhat comfortable). Only 11 percent say they are not comfortable.

- About one in five (21%) of those who are less likely to believe that their health information is safe and that only authorized individuals have access to this information are uncomfortable with researchers using their information (1-3 on a 7-point scale).
- Those who say they are not comfortable sharing their health information without giving consent are also less comfortable with researchers accessing their personal health information (21% rate their level of comfort 1-3 on a 7-point scale).

Use of health information in fundraising

Q: In some provinces, hospitals rely on basic information about their patients such as a person's name and address in their attempts to raise money through various fundraising activities. Which of the following statements is closer to your point of view?

Hospitals should NOT be able to use even basic information on patients for fundraising activities without directly asking for permission, even if this makes it far more difficult to raise funds

62

It is okay for hospitals to be able to use basic information for fundraising activities without directly asking for permission because it is a worthy cause and there is little real risk to a person's privacy

36

Neither 1

0 25 50 75 100

Base: All Canadians; Aug/Sept. 04, n=2500

Use in Fundraising

A majority of Canadians do not support the use of their personal health information in hospital fundraising activities without their consent.

Nearly two-thirds of Canadians (62%) do not think that hospitals should be allowed to use basic patient information (e.g., name, address) in fundraising activities without directly asking for permission, even with the caveat that not allowing hospital fundraisers to use this information would make raising funds far more difficult.

That being said, a minority (36%) feels that it is acceptable for hospitals to use this type of patient information because it is for a good cause and does not really threaten a patient's privacy.

- Respondents living in Atlantic Canada (70%) are significantly more likely to be opposed to the use of health information in hospital fundraising.
- Youth are more likely to consider the use of this type of information for fundraising to be acceptable (48% compared to 35% of those 25-44, 31% of those 45-64 and 37% of seniors).

Use of health information by the police

Q: In Canada, police forces can gain access to health information from health providers based on a subpoena, court order or warrant. Police argue that, under certain circumstances, they require greater access to Canadian's health information in order to be able conduct lawful investigations and to protect public safety. Which of the following statements is closer to your point of view?

Base: All Canadians; Aug./Sept. 04, n=2500

Use by the Police

A majority of Canadians do not object to the use of personal health information by the police.

Although police can currently access health information through a subpoena, court order or warrant, some argue that, under certain circumstances, they require greater access to health information in order to conduct investigations and protect the public.

Overall, a majority of Canadians (68%) are highly supportive of the police having access to health information for this purpose, and less than one in three (29%) worry that granting the police greater access to health information might prevent some individuals from seeking health care.

- Across Canada, residents of Quebec (34%) are more likely than those living elsewhere in Canada to think that police should not have increased access to Canadian's personal health information.
- Support for police having greater access to Canadian's health information decreases with level of educational attainment. For instance, 72 percent of those with a high school education or less support greater access, whereas 63 percent of the university educated are in favour.
- Support for increased access also declines with age (74% of youth support compared to 64% of seniors).

Use of health information by spiritual counselors

Q: Religious and spiritual counseling in hospitals is an important activity for many patients and family members. As you may know, religious and spiritual counseling can be provided by individuals of a specific faith, such as a Roman Catholic or Anglican priest who is not a member of the hospital staff, or individuals who provide general religious and spiritual support, such as a hospital chaplain who is a member of the hospital staff. Which of the following statements is closer to your point of view?

Q: Which of the following statements is closer to your point of view?

Base: All Canadians; Aug./Sept. 04, half sample

Use by Spiritual and/or Religious Counsellors

Most Canadians surveyed do not believe that spiritual counsellors should have access to health information without the express consent of the individual they are counselling.

Regardless of whether or not the guidance is coming from a hospital chaplain or someone of a specific faith, such as a Priest or a Minister, most Canadians do not feel that these individuals should have access to personal health information without the express consent of the person they are counselling.

Indeed, eight in ten (81%) Canadians say that health information should not be shared with a spiritual counsellor of a specific faith without the patient's permission, even if it makes it more difficult to provide counselling.

- Residents of Quebec are somewhat more likely than average to say that health information should not be shared with religious counsellors of a specific faith without the person's express consent (86%).

Similarly, 78 percent of the public says that this type of information should not be provided to a hospital chaplain without the consent of the individuals seeking the counselling. On the other hand, one in five Canadians (20%) say that it is okay for someone like a chaplain to assume that they have the consent of the individual they are counselling in order to provide them with religious/spiritual support.

- Canadians with lower than average socioeconomic status are more likely to say that hospital chaplains should be able to assume that they have the individuals consent to see their health information.

Appendix A: Interaction with the Health Care System

Interaction with the Health Care System

Questions in this section were asked with the express purpose of examining whether or not interaction with the health care system impacted Canadians attitudes towards different aspects of the Framework. Somewhat surprisingly, there are relatively few differences in broad attitudes, although some did exist (as highlighted throughout the report).

The following provides a brief overview of these indicators:

- A large majority of Canadians (90%) have, either personally or with a member of their family, visited a family physician or clinic over the past 12 months.
- More than two-thirds (68%) of Canadians say that either they themselves or a member of their family have been admitted to a hospital in the past five years. A sizable proportion (31%), however, has never been admitted to a hospital.
 - For those who have been hospitalized, most (41%) say they have been admitted 1-2 times in the past five years, 18 percent 3-5 times and nine percent have been admitted five or more times.
- A doctor's private office is the place that most Canadians (65%) typically go to for medical care. Walk-in clinics are the second most frequented (36%), followed by emergency rooms in hospitals (22%). Approximately one in ten also say that they are most likely to seek care at a doctor's offices in a hospital (11%) or in a community health centre (eight percent).
- Canadians overwhelmingly rate their health positively. Indeed, the majority (86%) rate their health as being good to excellent (28% say "good", 35% say "very good" and 23% say "excellent"). One in ten (10%) rate their level of health as being "fair" and only three percent say they are in poor health.

Visit to physician of past 12 months

Q: Over the past 12 months have you, or a member of your immediate family, visited a family physician or clinic?

Base: All Canadians; Aug./Sept. 04, n=2500

Visit to hospital over past 5 years

Q: And over the past 5 years have you, or a member of your immediate family, been admitted to a hospital?

PRI6A

12f

Does knowing there are independent bodies such as federal and provincial Privacy Commissioners that are responsible for investigating and resolving complaints make you more or less confident that your health information will be safe and secure?

- 1 Much less confident 1
- 2 2
- 3 3
- 4 No impact 4
- 5 5
- 6 6
- 7 Much more confident 7
- DK/NR 9

PRE3

I now want you to think about the way in which Canadians' health information is collected, used, and shared in the health care system today.

AP

13a

Currently your doctor and other health service providers do not have to ask your permission to share your health information with a health service provider who is treating you. Doctors assume that when individuals come for care and treatment, it is acceptable to share information with other health service providers who will be providing care and treatment to you.

APP

13a-7c

Thinking about your doctor needing to share SOME OF YOUR HEALTH INFORMATION with another health service provider who is providing care and treatment to you, I want you to tell me how comfortable you are with the following approaches. Please use a 7-point scale, where 1 is extremely uncomfortable, 7 is extremely comfortable, and 4 is somewhat comfortable.

APP1

13a

How comfortable are you with ...

your doctor sharing your health information with another health service provider who is providing care and treatment to you without explicitly asking for your permission.

- 1 Extremely uncomfortable 1
- 2 2
- 3 3
- 4 Somewhat comfortable 4
- 5 5
- 6 6
- 7 Extremely comfortable 7
- DK/NR 9

PRE5

Individuals can be informed about their rights regarding the use and sharing of their personal health information in a number of ways. One way is by reading notices, brochures, and pamphlets in health service providers' offices that inform individuals that unless they say otherwise their health care provider is allowed to share their personal health information without their explicit consent in order to provide them with care and treatment

BROC

15 Have you ever read notices, brochures, and pamphlets in your doctor's office that informed you of how your health information is being used?

- Yes 1
- No 2
- DO NOT RECALL 8
- DK/NR 9

EKN

16 How effective ARE the notices, brochures, and pamphlets in your doctor's office as a way of informing you about how your health information is used? Please use a scale from 1 to 7, where 1 is not at all effective, 7 is extremely effective, and 4 is somewhat effective.

- 1 Not at all effective 1
- 2 2
- 3 3
- 4 Somewhat effective 4
- 5 5
- 6 6
- 7 Extremely effective 7
- DK/NR 9

EKN1

17 How effective DO YOU THINK notices, brochures, and pamphlets in your doctor's office WOULD BE as a way of informing you about how your health information is used? Please use a scale from 1 to 7, where 1 is not at all effective, 7 is extremely effective, and 4 is somewhat effective.

- 1 Not at all effective 1
- 2 2
- 3 3
- 4 Somewhat effective 4
- 5 5
- 6 6
- 7 Extremely effective 7

PRIB

Health information is also used and shared by government health departments and some organizations without requiring your consent in order to improve the quality of health care and the management of the health care system. However, the information does not usually identify the individual as these groups are expected to make sure that they use the least amount of information and that the information is kept anonymous.

CC

I am going to read to you some examples of when information can be used or shared without your consent and I would like you to tell me how comfortable you are with each of the following on a 7-point scale, where 1 is not at all comfortable, 7 is extremely comfortable, and 4 is somewhat comfortable.

NC1

How comfortable are you with ...
your health information being monitored by health service providers and departments to prevent fraud against the health care system?

 7 Extremely comfortable 7
 DK/NR 9

NC3*How comfortable are you with ...*

your health information being accessed by health service providers and departments to better anticipate and address the health needs of the public, including dealing with things like the spread of diseases such as SARs?

- 1 Not at all comfortable 1
 2 2
 3 3
 4 Somewhat comfortable 4
 5 5
 6 6
 7 Extremely comfortable 7
 DK/NR 9

MR

Health research attempts to determine things such as causes of illnesses and possible cures. Some research involved collecting information directly from individuals after obtaining their consent. Other research involves using health information in large databases held by governments and hospitals where it is difficult or impossible to obtain an individual's consent.

MRB

Before they can have access to Canadians' health information, health researchers must go through a rigorous privacy process including an ethics committee and sign agreements that place restrictions on what can be done with any information, including ensuring that no individuals can ever be identified.

MR1

20b

How comfortable are you with health researchers having access to your health information for research purposes? Please use a 7-point scale, where 1 is not at all comfortable, 7 is extremely comfortable, and 4 is somewhat comfortable.

1 Not at all comfortable	1
2	2
3	3
4 Somewhat comfortable	4
5	5
6	6
7 Extremely comfortable	7
DK/NR	9

FUNDA

21

In some provinces, hospitals rely on basic information about their patients such as a person's name and address in their attempts to raise money through various fundraising activities. Which of the following statements is closer to your point of view?

1-Some people say that hospitals should NOT be able to use even basic information on patients for fundraising activities without directly asking for permission, even if this makes it far more difficult to raise funds

2-Other people say that it is okay for hospitals to be able to use basic information for fundraising activities without directly asking for permission because it is a worthy cause and there is little real risk to a person's privacy.

8-(DO NOT READ) Neither

9-(DO NOT READ) DK/NR

POLA

22

In Canada, police forces can gain access to health information from health providers based on a subpoena, court order or warrant. Police argue that, under certain circumstances, they require greater access to Canadian's health information in order to be able conduct lawful investigations and to protect public safety. Which of the following statements is closer to your point of view?

1-Some people say that police should be able to access health information if it is needed to help with investigations of crimes.

2-Other people say that police should NOT be able to access health information because it could stop some individuals from seeking health care.

8-(DO NOT READ) Neither

9-(DO NOT READ) DK/NR

PAS

Religious and spiritual counseling in hospitals is an important activity for many patients and family members. As you may know, religious and spiritual counseling can be provided by individuals of a specific faith, such as a Roman Catholic or Anglican priest who is not a member of the hospital staff, or individuals who provide general religious and spiritual support, such as a hospital chaplain who is a member of the hospital staff.

PAS2A

Which of the following statements is closer to your point of view?

1-Some people say that health information should be shared with religious counselors of a specific faith without the express consent of individuals they are counseling.

2-Other people say that health information should NOT be shared with religious counselors of a specific faith, without the express consent of individuals even if it makes it more difficult to provide counseling.

8-(DO NOT READ) Neither

9-(DO NOT READ) DK/NR

PAS3A

Which of the following statements is closer to your point of view?

1-Some people say that health information should NOT be shared with individuals who provide general religious/spiritual support such as a hospital chaplain WITHOUT the express consent of an individual.

2-Other people say that it is acceptable for individuals who provide general religious/spiritual support such as a hospital chaplain to ASSUME they have the consent of an individual to see their health information in order to be able to provide religious/spiritual support.

PRE2

Les renseignements sur la santé des Canadiens servent à offrir des services de santé, à financer les services de santé et à gérer le système de soins de santé en général. Ces renseignements sont conservés à différents endroits, comme les cabinets de médecin, les hôpitaux et les laboratoires ou cliniques. Les Canadiens ont le droit de demander une copie des renseignements médicaux les concernant à ceux qui leur dispensent des soins et peuvent demander que des corrections y soient apportées.

SAF

A votre avis, les renseignements médicaux qui EXISTENT à votre sujet sont-ils bien protégés? Veuillez répondre à l'aide d'une échelle de 1 à 7; où 1 veut dire pas du tout protégés, 7 extrêmement bien protégés et 4, assez bien protégés.

1 Pas du tout protégés	1
2	2
3	3
4 Assez bien protégés.....	4
5	5
6	6
7 Extrêmement bien protégés.....	7
NSP/NRP	9

PRE3

Je veux que vous pensiez maintenant à la façon dont les renseignements sur la santé des Canadiens sont recueillis, utilisés et échangés aujourd'hui à l'intérieur du système de soins de santé.

AP

A l'heure actuelle, votre médecin et les autres professionnels de la santé ne sont pas obligés de vous demander votre permission pour partager les renseignements médicaux vous concernant avec un prestataire de services de santé qui vous traite. Les médecins supposent qu'il est acceptable, lorsque des patients viennent les consulter, de partager l'information les concernant avec d'autres prestataires de services de santé qui les traiteront.

APP

Sachant que votre médecin pourrait devoir partager CERTAINS DES RENSEIGNEMENTS MÉDICAUX VOUS CONCERNANT avec un autre professionnel de la santé qui vous traite, je veux que me disiez si vous êtes à l'aise ou mal à l'aise à propos de ce qui suit. Veuillez utiliser une échelle de 7 points où 1 veut dire pas du tout à l'aise, 7 extrêmement à l'aise et 4 assez à l'aise.

APP1

Êtes-vous à l'aise... à l'idée de savoir que votre médecin partage les renseignements médicaux vous concernant avec un autre prestataire de services de santé qui vous traite sans vous demander explicitement la permission.

1 pas du tout à l'aise	1
2	2
3	3
4 Assez à l'aise	4
5	5
6	6
7 Extrêmement à l'aise	7
NSP/NRP	9

PRIB

Des renseignements médicaux peuvent aussi être transmis, sans que vous ayez à donner votre consentement, aux ministères gouvernementaux de la Santé et à certaines organisations qui s'en servent pour améliorer la qualité des soins de santé et la gestion du système de soins de santé. Cependant, ces renseignements ne permettent habituellement pas d'identifier les personnes qu'ils concernent puisque ces organismes sont censés s'assurer qu'ils utilisent le moins de renseignements possible et que ceux-ci demeurent confidentiels.

CC

Je vais vous donner quelques exemples de cas où des renseignements vous concernant peuvent être utilisés ou transmis sans votre consentement et j'aimerais que vous me disiez dans quelle mesure vous êtes à l'aise à propos de chacun des énoncés à l'aide d'une échelle de 7 points où 1 veut dire pas du tout à l'aise, 7 extrêmement à l'aise et 4 assez à l'aise.

NC1

Êtes-vous à l'aise à...

l'idée que les renseignements médicaux vous concernant fassent l'objet d'une surveillance de la part des prestataires de services de santé et des ministères de la Santé pour prévenir la fraude contre le système de soins de santé?

1 Pas du tout à l'aise.....	1

MR

Les recherches en santé ont pour but de déterminer les causes des maladies et d'y trouver des remèdes. Certaines recherches nécessitent la collecte de renseignements auprès des intéressés après avoir obtenu leur consentement. D'autres recherches obligent les chercheurs à puiser des renseignements médicaux dans de grandes bases de données des gouvernements et des hôpitaux, ce qui fait qu'il est difficile ou impossible d'obtenir le consentement des intéressés.

MRB

Avant de pouvoir accéder aux renseignements sur la santé des Canadiens, les chercheurs doivent se soumettre à un processus rigoureux de protection de la vie privée, y compris un comité d'éthique, et signer des accords qui imposent des restrictions à ce qu'ils peuvent faire avec ces renseignements, dont veiller à ce que les intéressés ne puissent jamais être identifiés.

MR1

Êtes-vous à l'aise à l'idée que les chercheurs en santé aient accès, aux fins de recherche, à des renseignements médicaux vous concernant? Veuillez utiliser une échelle de 7 points où 1 veut dire pas du tout à l'aise, 7 extrêmement à l'aise et 4 assez à l'aise.

1 Pas du tout à l'aise.....	1
2	2
3	3

FUNDA

Dans certaines provinces, les hôpitaux se servent de renseignements de base sur leurs patients, comme leurs nom et adresse, pour recueillir des fonds au moyen de différentes activités de financement. Lequel des énoncés suivants se rapproche le plus de votre propre point de vue?

1-Certaines personnes disent que les hôpitaux ne devraient PAS pouvoir utiliser même des renseignements de base sur les patients pour des activités de financement sans leur en avoir demandé directement la permission, même s'il était ainsi beaucoup plus difficile de recueillir des fonds.

2- D'autres sont d'accord pour dire que les hôpitaux devraient pouvoir utiliser des renseignements de base pour les activités de financement sans obtenir directement la permission des intéressés, puisque c'est une cause louable qui comporte peu de risques pour la protection de la vie privée.

8-(NE PAS LIRE) Ni l'un ni l'autre

9-(NE PAS LIRE) NSP/NRP

88: POLA

Au Canada, les services de police peuvent avoir accès aux renseignements sur la santé dont disposent les prestataires de soins au moyen d'une assignation, d'une ordonnance du tribunal ou d'un mandat. Ils soutiennent qu'ils doivent avoir plus facilement accès, dans certaines circonstances, aux renseignements médicaux des Canadiens pour pouvoir mener des enquêtes licites et assurer la sécurité publique. Lequel des énoncés suivants se rapproche le plus de votre propre point de vue?

1-Certaines personnes disent que les services de police devraient avoir accès aux renseignements médicaux s'ils en ont besoin pour des enquêtes criminelles.

2-D'autres affirment qu'ils NE devraient PAS avoir accès aux renseignements médicaux, parce que certaines personnes pourraient ainsi ne pas demander les soins dont elles ont besoin.

8-(NE PAS LIRE) Ni l'un ni l'autre

9-(NE PAS LIRE) NSP/NRP

PAS

Le réconfort religieux et spirituel dans les hôpitaux est très important pour de nombreux patients et les membres de leurs familles. Comme vous le savez peut-être, ce réconfort peut être offert par une personne d'une confession particulière, comme un prêtre catholique ou anglican, qui ne fait pas partie du personnel hospitalier, ou pas des gens qui offrent un soutien religieux et spirituel général, comme un aumônier qui fait partie du personnel hospitalier.

PAS2A

Lequel des énoncés suivants se rapproche le plus de votre propre point de vue?

1-Certaines personnes disent que les renseignements médicaux devraient pouvoir être divulgués à des conseillers religieux d'une confession en particulier sans le consentement explicite de ceux qui bénéficient de leurs conseils.

2-D'autres affirment que les renseignements médicaux NE devraient PAS être divulgués à des conseillers religieux d'une confession en particulier sans le consentement explicite des intéressés même si cela veut dire qu'il serait plus difficile d'offrir du réconfort.

8-(NE PAS LIRE) Ni l'un ni l'autre

9-(NE PAS LIRE) NSP/NRP

PAS3A

Lequel des énoncés suivants se rapproche le plus de votre propre point de vue?

1-Certaines personnes disent que les renseignements médicaux NE devraient PAS être divulgués à ceux qui offrent un réconfort religieux/spirituel générale comme l'aumônier d'un hôpital SANS le consentement de l'intéressé.

2-D'autres affirment qu'il est acceptable pour ceux qui offrent un réconfort religieux/spirituel général, comme un aumônier d'hôpital, de SUPPOSER qu'ils ont le consentement de l'intéressé pour pouvoir offrir un tel réconfort.

8-(NE PAS LIRE) Ni l'un ni l'autre
